

Testimonial

The new touch screen version of the newborn hearing screening device, MADSEN AccuScreen, features a whole new range of options that have to be experienced.

When using the device for daily screening, the user will appreciate first of all the simplicity of the probe calibration and of the equipment check. The probe is much better protected against obstruction in the ear than the previous version.

The password-protected touch screen is very easy to use and undeniably saves time. Even the PC interface is simple and useful.

The OAEs are obtained faster than with the previous version, and the display of target points helps the clinician in deciding whether to accept an inconclusive result or to redo the test.

La Timone Hospital - Marseille, France

With the new MADSEN AccuScreen you can now not only perform an ABR test on one ear at a time, in sequence, but it is also possible to do the ABR recording on both ears at the same time (with specific ear couplers), which is undeniably more efficient.

It meets all needs for screening on the maternity ward. For healthy infants that means first testing with OAE or ABR and if necessary, follow with an ABR retest. For at risk infants that means first an ABR test and if necessary, follow with an ABR retest.
